Project Title: Deep Sea Fish Microsite

This will be an informational website about deep sea fish—both general facts and the different categories of deep sea fish. This site will either have a large homepage covering general information or a very short homepage that only serves to direct the user to the informational pages via links. I would like to distinguish the different categories of fish with separate pages, which should have something unique about their links that demonstrates their significance. Pictures will be pretty relevant for this subject, and they should be neatly organized with the textual information.

Home Page/Introduction

A home page that will include a large, eye-catching, bannerlike image and a brief overview of deep sea fish.

Evolution

Contains the contents on the Wikipedia page. I'm not sure an image is required here.

Environment

Possibly model this after depth diagrams, so each block of information is distinguished by some indication of depth or segmentation.

Characteristics

Include a large diagram on this page?

Mesopelagic Fish

This page will contain all the information on mesopelagic fish. It would be interesting to include the different types of mesopelagic fish, and some way to interact with their images (like clicking on them for information).

Bathypelagic Fish

This page will contain all the information on bathypelagic fish. Treat this similarly to the mesopelagic page, but perhaps with some stylistic distinction that indicates the relationship between the two categories.

Sources and Details of Creation

This page will contain the sources for the information and images, as well as some brief details about the creation of the page as necessary.
